

ABSTRACT

A light emitting diode comprising: a pair of electrodes;
and a light emitting layer interposed between the pair of
5 electrodes, wherein the light emitting layer has a light emitting
region containing a luminescent material and having a higher
refractive index than air and a low refractive region having
a lower refractive index than the light emitting region, and
at least part of an interface between the light emitting region
10 and the low refractive region is unparallel to a plane of the
electrodes.
